### **NAME**

CURLOPT\_SSLKEY - specify private keyfile for TLS and SSL client cert

### **SYNOPSIS**

#include <curl/curl.h>

CURLcode curl\_easy\_setopt(CURL \*handle, CURLOPT\_SSLKEY, char \*keyfile);

### DESCRIPTION

Pass a pointer to a zero terminated string as parameter. The string should be the file name of your private key. The default format is "PEM" and can be changed with *CURLOPT\_SSLKEYTYPE(3)*.

(iOS and Mac OS X only) This option is ignored if curl was built against Secure Transport. Secure Transport expects the private key to be already present in the keychain or PKCS#12 file containing the certificate.

### **DEFAULT**

NULL

# **PROTOCOLS**

All TLS based protocols: HTTPS, FTPS, IMAPS, POP3S, SMTPS etc.

### **EXAMPLE**

**TODO** 

### **AVAILABILITY**

If built TLS enabled.

### **RETURN VALUE**

Returns CURLE\_OK if TLS is supported, CURLE\_UNKNOWN\_OPTION if not, or CURLE\_OUT\_OF\_MEMORY if there was insufficient heap space.
